## Adding a Calculator App to the SDRO1 App Joe McCarty

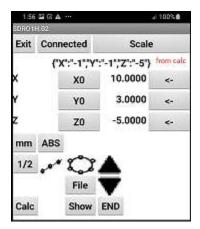

A screenshot of the SDRO1H\_02 Android Application. A Calc. button has been added to the lower left. The Calc. button uses the Activity Starter component of App Inventor to launch a second application SDRO1calc B.

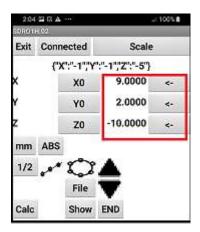

The calculator application screen. The data sent by the calling application is at the top and is annotated by the red text. Data to return to the calling application is at the bottom and is annotated in red. The X, Y, and Z buttons move input data into the accumulator. The =X, =Y, and =Z buttons move the accumulator to the output data.

-1 was entered into the accumulator and then copied to the x and Y outputs using the =X and +Y buttons. The Z button was used to copy the -5 Z input value to the accumulator and the =Z button copied the -5 value in the accumulator to the Z output. Press the Ex button to return to the calling application.

Having returned to SDRO1 the values returned by the calculator appear near the top of the display. A red annotation indicates the position. The <- buttons on the right of each axis will add the return value to the Offset portion of the display equation. Pressing each <- button once produces the following display.

$$X = 10 - 1 = 9$$

$$Y = 3 - 1 = 2$$

$$Z = -5 - 5 = -10$$

## **The Display Equation**

There are three equations one of each axis. Depending on the INC/ABS (Incremental/ Absolute) display mode they take the following forms:

Display = Offset + Incremental + Absolute. For Incremental and,

Display = Offset + Absolute. For Absolute mode.

```
THE PROOF OF THE P
```

Program blocks used to calculate the display value.

Internally values are carried in mm.

## **Zeroing**

The XO, YO, and ZO buttons depend on the ABS/INC button.

In ABS (Absolute) mode the zero buttons send a message to the Arduino hardware to zero the counter.

```
when DBzeroX . Click
do o if compare texts DBabsinc
                                            Text • = •
           call BluetoothClient1 . SendText
                                                X0
           set value for key
                              get global INC .
               in dictionary
                             get value for key
                                                                             get value for key
                                                      get global ABS
                                                                                               get global Scalefactor
                                       in dictionary
                                                                                 in dictionary
                                      or if not found
                                                       0
                                                                               or if not found
                                                                                               0
     set value for key
         in dictionary
                      get global Offset *
```

Zeroing the X axis.

The pattern END button zeros the offset and clears the pattern buffer.
